Guitar HD IR Pack 1

Guitar Cabinet Impulse Pack

Description

The **Guitar HD IR Pack 1** is a collection of impulse responses recorded from 10 different guitar cabinets.

For many years we've been relentlessly working on recording impulse responses from all sorts of guitar cabinets, ranging from world-famous classics to relative underdogs. This pack contains IR mixes which provide the closest representation of the cabs' character to our ears and can be used in any music genre. We used the same approach when making the widely popular **Bass HD IR Pack**, so now it's time to unveil a matching guitar cab IR pack!

To save you from endless scrolling through mic placement options, we've prepared 4 mic placement options per cabinet, each sitting well in the mix with no extensive post-processing required. The pack has a total of 80 high-definition WAV files recorded from 10 cabs: 40 mono impulses and 40 stereo versions recreate the cabs' sound in the room where they were recorded. The impulses can be used with hardware and software IR players. The maximum impulse length in the pack is 500 ms, but we've also prepared 250ms, 125ms and 20ms versions so that you could select the best-fitting one with no extra hassle.

Foreword

Rather than raw "cab + mic" snapshots, the impulses in the Guitar HD IR Pack 1 are instead multi-mic mixes with frequency correction applied. For this reason, we've opted not to elaborate which mics were used when recording individual impulses. For each cabinet, we picked a set of mics which captured the cab's character the best to our ears. With this approach, detailing the mics and their balance in each case wouldn't really make sense. With the Guitar HD IR Pack 1, our goal was to create an impulse pack that would make bass players' lives easier on stage and at the studio, and we hope you find it useful in your work.

Features

Any impulses from the Guitar HD IR Pack 1 with the same length and bitrate can be blended together with no frequency response issues (such as comb filtering or the lows disappearing). This is due to the fact that all impulses in the pack are in phase with each other.

Additionally, all impulses have been mastered to an almost identical subjective perceived volume (ITU-R BS.1770 LKFS standard). The volume of the longest (500ms) impulses is around -35 LUFS (-32 LUFS for stereo versions). Shorter impulse versions also have equal volume, except this time Total RMS is used (this allows to achieve minimal volume fluctuations when using hardware IR players). Please avoid normalizing the impulses to 0 dB as it can lead to significant differences in their perceived volume.

The collection includes impulses of different lengths — not just because certain impulse players can only process a particular length, but also because shorter impulses have less room reverb data. "The longer, the better" doesn't apply to cabinet impulses; instead, it boils down to personal preference: some prefer impulses with more "volume" while others go for dry-sounding ones (and blend in some early reverb reflections if needed). The only objective difference is this: short impulse lengths (such as 20 ms) are less precise in the lows. It's up to you to decide if you prefer that or not.

All impulses in the pack were recorded with a neutral power amp. EQ was later applied to achieve a more balanced final sound. If you feel that an impulse sounds too dark or too bright, feel free to use an EQ and/or adjust the rest of your signal chain to achieve the tonal balance you need.

Impulse Details

1. **Fender_DR:** Impulse responses recorded from the cab of the Fender Deluxe Reverb combo amp. Equipped with a single Jensen P12R Alnico speaker, this compact open-back combo provides the classic chiming vintage sound with mild highs and tasteful breakup tones. Despite its small size, it fits very well in most music genres and is a perfect choice for studio recording.

2. **Yerasov_BSG:** Impulse responses recorded from the Yerasov Bluespace G cab, which was specifically designed to be used with the Yerasov Bluespace H amp. With its open-back design, fixed mesh and 12-inch Celestion Greenback speaker, the cab works great for both clean and distorted tones. You can find an impulse pack recorded from that cab on our website.

3. **Hiwatt_SEF:** Impulse responses recorded from the Hiwatt SE212F cab with two 12-inch Fane Hiwatt Heavy Duty speakers. This "almost closed-back" cab has a small port on the back which, along with the low-mounted speakers, contributes to its unique voicing. This cab has a "quick" and detailed response over a wide frequency range (even suitable for bass guitar) as well as very characterful mids. The raw impulses were recorded by Nikita Demchenko.

4. **Orange_JR:** Impulse responses recorded from the Orange Jim Root closed-back cabinet with two 12-inch Voice of the World speakers. As Jim Root's signature model, this cab was specifically designed for modern heavy music genres and delivers a focused "punch" along with crushing low mids. It's not a one-trick pony though: this cab can also fit very well in less aggressive styles and works particularly great for rock music.

5. **Vox_AC30:** Impulse responses recorded from the VOX AC30 with two 12-inch Celestion Alnico Blue speakers. This is the classic British sound with its unmistakable mids. Mid-gain tones are probably this cab's strongest suit, but it works equally great for clean and edge-of-breakup sound.

6. **Sunn_200S:** Impulse responses recorded from the SUNN 200s cab. This monstrous cab with a peculiar design is one of our all-time favorites. Two 15-inch speakers with a slotted bass reflex in between create a one-of-a-kind voice. To our ears it sounds equally great with guitar and bass: it all depends on how you choose to record it (for this pack, we focused on guitar applications). Highly recommended if you are a doom/sludge enjoyer.

7. **Fender_BM:** Impulse responses recorded from the Fender Bassman combo amp with four 10-inch Jensen P10Q speakers. This open-back cab is a true blues classic which feels at home in other genres too. This cab's growling tone character is truly its calling card.

8. **Marshall_1960:** Impulse responses recorded from the Marshall 1960 closed-back cabinet with four Celestion G12T-75 speakers. This is the de facto industry standard for old-school rock and metal. We couldn't miss the chance to include this legendary cab in this pack.

9. **Mesa_STD:** Impulse responses recorded from the legendary oversized Mesa Recto Standard cab with four 12-inch Celestion Vintage 30 speakers. If you love low tunings with no overbearing lows, this cabinet is the perfect choice. It also boasts phenomenal mids for distorted tones.

10. **Peavey_5150:** Impulse responses recorded from the Peavey 5150 closed-back cab with four 12-inch Sheffield 1200 speakers. This is the most aggressive cab in the whole pack, and it's an amazing choice for heavy genres with fast riffing due to its focus, punch and clarity. It also has a very interesting clean character, so make sure to try it even if you aren't a fan of metal.

Pack Structure

This IR pack consists of 80 impulses recorded from 10 guitar cabinets. For each cab, there are 4 mono and 4 stereo versions. Each impulse has different length versions in 3 formats.

The available formats are split into folders as follows:

- **The 96k folder** includes 96k@24bit WAV files. These are the max resolution versions (HD).
- **The 48k folder** includes 48k@24bit WAV files (the current industry standard).
- **The 44k folder** includes 44.1k@16bit WAV files. This is the classic CD quality format. *We recommend using those if your impulse player doesn't support the 48k or 96k formats.*

Each of the folders above has 4 subfolders for different impulse lengths:

- **The 500 folder** includes impulses with a length of 500 ms. Those are the most precise and "spacious" versions.
- **The 250 folder** includes impulses with a length of 250 ms. Such impulses have high precision and medium "space".
- **The 125 folder** includes impulses with a length of 125 ms. Those are highly precise but have the minimum amount of "space".
- **The 20 folder** includes impulses with a length of 20 ms. Such impulses lack precision but offer the "driest" sound possible. ***These files can be used with the Shift Line CabZone X and Twin MkIIIS IR players.***

  Once again, high precision doesn't necessarily mean the best sound. Each of the lengths provided in the pack can produce great results, so try them all and see what works best for you.

Each length folder has 3 subfolders:

- **Mono:** 40 mono files (PCM1).
- **Stereo:** 40 stereo files (PCM2). These files have slight differences in frequency response between the right and left channels. They also differ from the mono versions in how the mics were set next to the speakers and in the room.
- **Stereo Split:** 80 mono files (PCM1). These are separate channel files for the Stereo versions. You can use these files if your impulse player doesn't allow channel selection. *The Mono and Stereo versions sound very similar but still have some differences. In this folder, you can select the file you need for mono use.*

All files in the pack follow the same naming convention: SL_XXX_Cab_Name_Y (mono), SL_XXX_Cab_Name_Y_ST (stereo) and SL_XXX_Cab_Name_Y_L/R (separate stereo channel). XXX denotes cabinet type (the size and number of speakers). ST always means that the file has two channels, while the L and R postfixes are used for separate stereo channels.

The Y suffix denotes one of the four cab versions:

- **A (Average):** a well-balanced sound which is the closest to the cabinet's real-life tone.
- **B (Bark):** a mid-heavy, "barking" tone which is perfect for solo parts and punching through a busy mix.
- **C (Crisp):** a detailed, bright and shimmery tone with prominent highs. This is a great choice if you want attack and clarity, particularly on clean or light overdrive.
- **D (Deep):** a deep and massive tone with prominent lows achieved by mic balance in the mix. This isn't the typical ribbon mic impulse response with overwhelming bass; instead, it's a deeper and more spacious version of the impulse which is a perfect choice for wall-of-sound tones.

Example: SL_410_Fender_BM_B_ST.wav is a stereo version of the impulse response recorded from Fender Bassman (a cab with 4 10-inch speakers) with boosted mids. It will work great for sustained low- to mid-gain solo parts.

Keep in mind that you can also blend each version with other impulses from the pack without any phasing issues.
